

Sterile burs for ophthalmology – stay on the safe side.

Prion transfer is considered a possible option in ophthalmology, which is why it is recommended to reprocess ophthalmic instruments with highly alkaline detergents, followed by steam sterilisation.

That being said, the implementation of these recommendations can be a nightmare for many ophthalmologists. The provision of suitable reprocessing systems, the lengthy procedure and the required documentation are extremely costly and time-consuming.

This is now a thing of the past, thanks to the single-use corneal rust ring removers provided by Komet Medical® which come in sterile packaging!

And, best of all, no more tedious waiting – the instruments are always ready for use!

The burs for ophthalmology come in two sizes:
